

# Travel Booking Engine

Improve Customers Satisfaction by Selling Via The Web  
Scale Revenues, Reduce Costs

## Travel Booking Engine

Travel Booking Engine is a highly flexible system designed for both business to business (B2B) and business to consumer (B2C) companies in both the back and front office. The platform provides a suite of realtime reservations management tools and inventory control for the selling of component, tailor-made, group, and escorted tours.

## Powerfull Api Connectivity

Travel Booking Engine provides both B2B and B2C access through API connectivity. By setting client specific selling policies, product and allocation rights, Travel Studio allows you to control different prices and allocations to different channels, applications and websites online. Bookings are directly created within the main application, allowing web bookings to be an integral part of your reservations process.

## Advanced Flight Booking

Linking directly with Travel Booking Engine, our net fares and flights module, Travel Booking Engine combines published, net & low cost fares in a single flight search for flight only or inclusive package bookings. Travel Booking Engine has preferred flight itineraries that can be preloaded and automatically populated into packages at time of booking.

## Easy Booking Feature

Travel Booking Engine can handle the most complex booking environments, with tailor made, package, escorted tour and group reservations. Travel Booking Engine spans all areas of the operations process, including sales invoices and purchase orders that link financial information directly into your accounts system.
